Perfect architecture

Java Homework Help

There are many different views on the development of architecture and design of modern applications. Some architects strive to think over everything to the smallest detail, to calculate the use cases of all classes and modules, analyze a million possible ways to use them, all of them must be documented and then proceed to the coding step.

Others, on the contrary, believe that it's time to think later and long time to do, so they throw themselves on the barricades with the cries of the cheer, giving out a ton on the mountain of not the right code. Like any extreme, this approach does not lead to anything good. But, as in many other cases, there is an intermediate option when the design and architecture pays due attention when they are not put at the head of the corner, and are used to identify the right abstractions and search for compromises in conflicting customer requirements.
